

Patient Information

Name: ravi  
Age: 22 Gender: Male  
Location: Bengaluru, Karnataka, India

Diagnosis Summary

Condition: Melanocytic nevi    Confidence: 94.5%    Risk: Low Risk  
Common moles - Monitor for changes

Medical Insights (AI)

**Important:**  
The information below is for educational purposes only and is **\*not** a substitute for a professional medical evaluation or diagnosis. If you have concerns about your skin or the results of any AI based analysis, please seek a qualified healthcare provider promptly.

---

Condition Overview

**Melanocytic nevi** (commonly called **\*moles\***) are benign growths of melanocytes-skin cells that produce pigment. Key points:

| Feature | Description |

|-----|-----|

| **\*Appearance** | Usually round or oval, dark brown or black, smooth surface. Size ranges from a few millimeters to over a centimeter. |

| **\*Etiology** | Result from proliferation of melanocytes during childhood or early adulthood; influenced by genetics, sun exposure, and hormonal changes. |

| **\*Prevalence** | Most people have several benign nevi; they are a normal part of skin biology. |

| **\*Risk** | The vast majority are harmless. A small minority may undergo malignant transformation (melanoma). The AI model flags this as **\*Low Risk** with 94.45 % confidence, indicating typical benign characteristics. |

| **\*Monitoring** | Any changes in size, shape, color, or sensation warrant medical review. |

---

## Important Precautions

- **Regular Self Examination**

- Inspect all visible skin areas (face, neck, arms, back, chest, legs) monthly.
- Use a mirror or a trusted partner for hard to see regions.
- Compare with a photo or diagram of your existing nevi to detect subtle changes.

- **Watch for the ABCDEs of Melanoma**

- **Asymmetry**, **\*Border** irregularity, **\*Color** variation, **\*Diameter** > 6 mm, **\*Evolving** or new symptoms (itch, bleeding).

- **Protect Your Skin from UV Radiation**

- Wear broad spectrum SPF 30+ sunscreen daily, reapply every 2 h when outdoors.
- Use protective clothing, hats, and sunglasses.
- Avoid peak sun hours (10 AM-4 PM) and tanning beds.

- **Document Changes**

- Keep a log or photo diary of any nevi that change over time.
- Note date, size, color, shape, and any symptoms.

- **Professional Evaluation**

- Schedule a dermatology appointment if you notice any of the ABCDE changes or if a mole becomes painful, itchy, or bleeds.
- A clinician may perform a dermoscopic exam or biopsy to confirm the benign nature of the lesion.

- **Stay Informed**

- Educate yourself about skin cancer signs but rely on professional guidance for diagnosis and treatment.

---

**Bottom line:** The AI model suggests that your mole is most likely a benign melanocytic nevus with low risk. However, only a trained dermatologist can definitively confirm this. Please arrange a professional skin check if you observe any changes or remain uncertain.
